

# Home sweet home

For many years, large screen projection TVs have been the ultimate solution for dedicated TV viewers. But what do you do if you want something absolutely unique? Well, you ask your AV installer to design a customised home theatre, which can be fitted perfectly into your living room.

For a growing number of consumers in the high-end market, customised rear pro solutions are seen as the state-of-the-art home theatre solution. While the biggest standard projection TVs use 80" screens, customised solutions can be designed with screen sizes of 72", 84", 100", 120", 135" or even 200" - in both 4:3 and 16:9 aspect ratio.

Depending on your image sources, this concept allows you to do anything from watching TV, video, internet and computer - right through to hosting a meeting in your own place.

On this page, you will find two examples of customised home theatres which illustrate how optical screens can be integrated in homes with different interior designs.

## Turkey

*The home theatre in this private home in Turkey was installed by the AV company Armoni from Istanbul. Armoni has been successful in the home theatre market with their winning combination of state-of-the-art optical rear projection screens and "conventional" CRT projectors, which are still proving their superiority when it comes to projection of video. The installation on the picture incorporates a Barco 708 MM projector and a 100" dnp Wide Angle Screen™.*

## UK

*This home theatre in a private home in the UK works like a giant high-res virtual TV. The solution was installed by Owl Video Systems, UK. A Seleo CRT projector drives this dnp Wide Angle Screen™ to perfection, presenting a sparkling image in even the brightest ambient light.*
